Technical Specialties

- Hypersonics
- Lubricants and mechanical systems
- Advanced-concept system analysis
- Fuels and propellants
- Plume phenomenology
- Advanced components

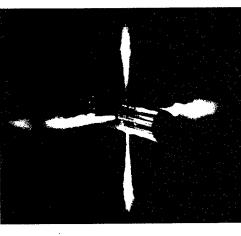

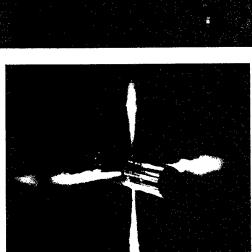

Aerophysics

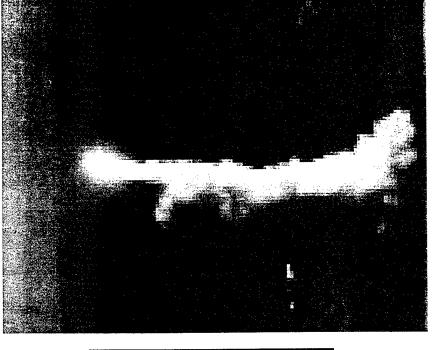

Rocket Combustion-from Propellant Injection to Plume Dissipation

- Supercritical combustion
- Plumes

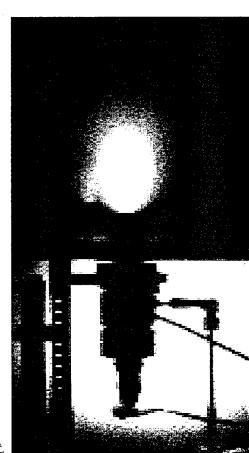

Nonequilibrium Flow Phenomena

Microthruster concept (1 to 100 µN thrust range)

Payoff

- Reduced production/launch costs for satellites
- Robust tracking via dual mode IR / UV sensors
- Increased spacecraft lifetime & survivability
- Speed deployment of new energetic propellants

Goals

- Identify the key mechanisms which control:
- The performance characteristics of microthrusters
- The intensity and spectrum of plume radiation signatures
- The decomposition and combustion of emerging energetic materials
- Contamination effects on spacecraft systems
- Design and evaluate novel microthruster concepts
- Provide 3D simulation tools for signature/contamination modeling

Air Force Micropropulsion Mission Requirements

Near-Earth orbital maneuver requirements

– Fast response time ⇒ High thrust

- Kinetic kill

⇒ Very high thrust

Many maneuvers ⇒ High specific impulse

Satellite size requirements

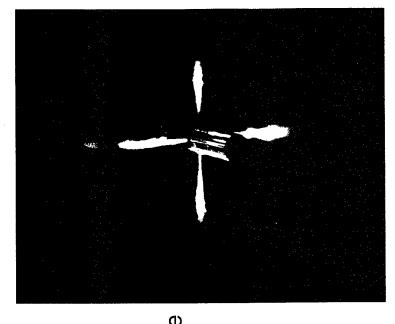

Microsatellites (1 g to 1 kg) ⇒

Communication/surveillance constellations

 Small satellites (> 100 kg) ⇒ Dedicated satellite communication and surveillance

 A whole range of thrusters is needed to fulfill this broad spectrum of requirements ⇒ Chemical, solid, electric, PDE

Critical need for advanced propulsion concepts and Simple scaled-down versions of existing thrusters do not maintain performance levels needed \Rightarrow approaches

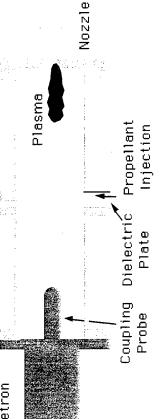

Microwave Microthruster

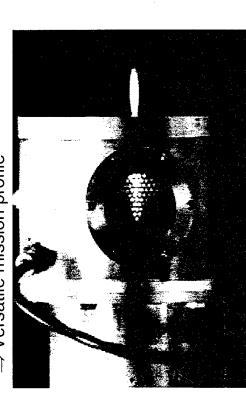

Description

- Electrodeless, vortex-stabilized arcjet thruster Magnetron
- Higher specific impulse than chemical systems; more thrust than higher specific-impulse electric devices
- Reduced erosion; increased payload mass; increased lifetime
- Broad range of propellants: N₂, He, H₂, NH₃, H₂O
- Broad range of power levels: 60 watts 30 kilowatts ⇒ Versatile mission profile

Resonant Cavity

Operation: Magnetron converts electrical energy to microwaves that heat propellant gases to plasma temperatures.

10-cm-diameter thruster operating at 5 kW

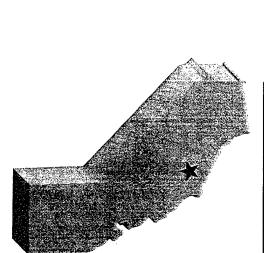

Mission Applications

- · Station keeping, attitude control, orbit boost
- Systems: Spartan, Mighty Sat, International Space Station, Shuttle payload boost

Program

- Improve thrust and efficiency by reducing energy loss (heat) to the boundary layer through viscous dissipation
- Joint experimental and analytical effort by AFRL/PRS with Penn State University

Manifold Cross Flow Can Cause Fan Misalignments and Reduce Chamber Lifetime

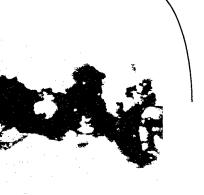

A variation in discharge coefficient could shift the spray sngle, potentially allowing oxidizer to reach the wall and cause failure or reduce lifetime.

Cant angles as large as 13° have been predicted.

Misalignment in the Fastrac outer row would be 5° at most.

Potential canting

due to cross flow effects

Potential misalignment

PRESSURE DEPENDENT MIXING LAYER STRUCTURE

Nitrogen/nitrogen system (P_{cr} = 493 psi, T_{cr} = 126 K) $T_{inj} = 128 \text{ K}$, $T_{amb} = 300 \text{ K}$, mass flow = 350 mg/s

Low Pres. Subcritical Droplets

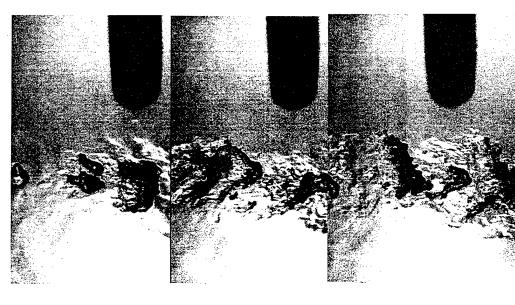

Mod. Pres. Supercritical Ligaments

High Pres. Supercritical Gas layers

High Pressure and Supercritical Combustion (6.1)

Transcritical Oxygen Drops in Nitrogen

OBJECTIVE

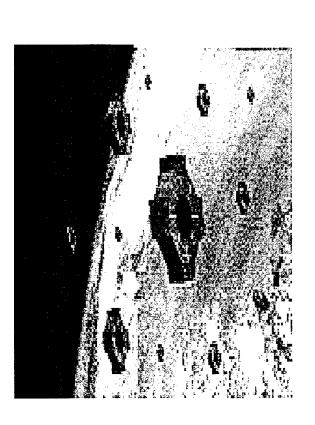

Determine the mechanisms which control the breakup, transport, mixing, and combustion of supercritical droplets, jets, and sprays.

APPROACH

- Piezoelectic cryogenic jet and drop generator in chilled helium.
- Produce acoustic waves using metallic actuators, design resonant modes, focus acoustic waves.
- Reduce optical path lengths.
- •Use spontaneous Raman scattering from a frequency doubled Nd-YAG laser.

Basic Research in Nonequilibrium Flow Phenomena

Objectives/Goals

- Identify the key mechanisms which control:
- The performance characteristics of microthrusters
- The intensity and spectrum of plume radiation signatures
- The decomposition and combustion of emerging energetic materials
- Contamination effects on spacecraft systems
- Design and evaluate novel microthruster concepts
 - Provide 3D simulation tools for signature/contamination of missiles and spacecraft
